Finding a freeware is easy but finding the one which you really want can take some time as there are so many applications available for one topic and installing, testing, un-installing a freeware takes time.

Below I will cover some of the most popular Windows Mobile Freeware.

Total Commander: Windows Mobile devices come with a file explorer and for most of the users, it's sufficient as it lets you copy, delete, paste and locate files. However, it's not sufficient for advanced users. Total Commander is a freeware that offers a number of features along with the features provided by the default file explorer. Total Commander lets an individual choose between the 2-window mode and the single window mode. It's loaded with a number of other features like registry editor, FTP client and many more. It can also be used to view and save the .zip files.

TenGo Free: Windows Mobile Devices have sufficient tools for entering a quick text note but if you want to enter a large amount of text then these tools are not sufficient. For such situations, TenGo is probably the best solution as it speeds up the process of entering text by using the predictive text technology which is also used in cell phones. With TenGo, all you need to do is to tap on the area of the screen where your letter lies and it'll then guess the word. This is a much simple process when compared to the process of clicking 26 separate letter keys and the symbol keys.

MortPlayer: The media player available in the devices running Windows Mobile has limited features and you can't do much with it other than playing the supported files. Now-a-days, a number of formats are available and the most of them are not supported by the default media player available in Windows Mobile. MortPlayer is a freeware that supports a number of popular formats like MP3, OGG. It also supports playlists and in addition to this, it lets you play media files from folders, favorites. It also has a bookmarking function which makes it a must to have freeware.

TCMP: TCMP stands for The Core Media Player and it is an audio/video player that supports a number of file formats and so, an end-user can use just one application for playing different files. TCMP is a much better media player when compared to the default media player available in Windows Mobile.
