

## How to Make My Computer Run Faster With 3 Simple Steps

Is your computer running too slow for you? Are you finding that it takes a long time to boot up, whereas before it was quick as a rabbit? Are you wondering, "How to make my computer run faster?" If your computer is running at turtle speed, you have come to the right place. In this article, we will outline three simple steps that you follow to make your computer run faster and more efficiently for your needs.

### Step #1 – Maintain Your Computer

Are you ready to get started? Great! The first thing you need to think about is the amount of websites that you visit on a daily basis. Did you know that with each website that you visit, you are literally downloading some of these files in efforts to make your computer load them faster the next time you want to access that same website? You are also downloading cookies from websites and saving a history of each site you visit.

All of these can dramatically affect your computer's speed and slow it down if you do not do something about it. So, to get rid of these things, you should make sure to clean it out. You can do this by making sure that you delete temporary files, browsing history, cookies, and empty out the recycle bin on your computer. This should be done regularly, weekly, bi-weekly, or monthly. In fact, some people perform this maintenance daily.

### Step #2 – Get Rid Of What You Don't Need

If you have too many programs on your computer, this could really put a damper on its speed. The first thing you need to do is delete any programs that you do not use. This can free up space and free up some speed. At the same time, you need to take a look at the items running on your computer at all times. These things, especially if unneeded, could have a major affect on the speed of your computer.

Therefore, you want to prevent unneeded programs from booting with your computer and running in the background. The safest way to do this is to go into the program options and find a box that says "run at startup" or something similar and uncheck the box. There are other ways, but if you do not know the necessary programs that must run on your computer, it is not a good idea to go those routes.

### Step #3 – Clean Out Your Registry

This is something that you will want to download a program for. Cleaning out your registry is not something that you want to do yourself. Your registry is basically the hub of your computer, one wrong move and it could render your computer completely useless. However, cleaning out the registry is a big step, one which must be done because it too can affect the speed of your computer. Left over files, errors, or deleted programs can still remain in the registry.

Registry cleaner downloads are available, download and scan your computer. After the scan, let the registry cleaner make the proper corrections.

Now that we've answered the question of "How to make my computer run faster," it is time to get started. Once you take these steps you will notice that using your computer for the internet, programs, or anything will be much faster and easier.
