

Wedding Bands: Comfort Fit For Maximum Comfort

Worn day and night from the time of a couples wedding, a comfortable wedding band is extremely important. If your wedding band bothers your hand, you are more likely to take it off at some point during the day or at night, increasing your chance of losing it. Comfort fit wedding bands give you that additional level of comfort so many people look for.

The Comfort Fit wedding band is currently the most preferred band on the market. With a comfort fit design, the inside of the band has a rounded finish so it cannot pinch your skin. They slide onto your finger easier and sit more comfortably than a traditional wedding ring.

Internally round bands, as comfort fit bands are also known, are especially suitable, and certainly more comfortable, for people not used to a ring, such as many men. They are also more comfortable for anyone that must frequently take their rings off.

Comfort fit wedding bands achieve comfort several ways, each a little differently due to the creative imagination and skills of the designers. Some of the many types include:

- Light Comfort Fit Wedding Band - Slightly rounded on the inside of the ring, giving it a smoother feel when worn, a light comfort fit wedding band is not as thick and contains less metal than both a heavy or regular comfort fit band.
- Regular Comfort Fit Wedding Band - Moderately rounded inside, this band slips on and off with ease and sits comfortable on your finger when you wear it.
- Heavy Comfort Fit Wedding Band - These rings are thick with a lot more metal than both light comfort fit rings, medium comfort fit rings, and standard wedding bands. The inside is extremely rounded which makes it comfortable to wear.

The smooth arc of some comfort fit wedding bands or engagement rings blends the inner and outer portions, making them feel comfortable on the finger, unlike pipe-cut rings. They have sharper edges and over time, the hard metal makes them less comfortable to wear. Comfort fit wedding bands that are two millimeters thick and four millimeters wide are the most popular men's ring. A wedding band could be anywhere from two millimeters to eight millimeters in size. A millimeter is approximately the size of a fine pencil lead.

It is very important to get the correct size of comfort fit wedding bands or engagement rings to get maximum comfort. It is easier to achieve a comfortable fit on smaller rings but adjusting the size helps for larger ring sizes. You may require a comfort fit wedding band one quarter size larger if the custom fit ring is extra wide, such as a six-millimeter or seven-millimeter ring. You must also take into account that the size of a persons finger fluctuates due to temperature, fluid retention, weight gain or loss. Titanium rings are extremely difficult to adjust the sizing on so it is important to order the correct size comfort fit wedding band. Because it is such extremely hard metal, it is almost impossible to reduce or increase their size after ordering.
